

Facility Location Optimizer

A tool for solving location problems.

Classification: **1 | P | $v > 0, w < 0$ | d_1 | median**

1. Problem formulation

The goal is to find one new facility $x \in \mathbb{R}^2$ in the plane such that the weighted sum of the distances between the new facility x and given attraction facilities located at the points $a^1, \dots, a^{m_1} \in \mathbb{R}^2$ as well as given repulsion facilities located at the points $b^1, \dots, b^{m_2} \in \mathbb{R}^2$ are minimized. Such problems are called

“Single facility median location problems with
attraction and repulsion points in the plane”

in the literature of location theory. Using the well-known Manhattan metric (also called rectangular metric or l_1 metric), which is defined by

$$d_1(x, y) := |x_1 - y_1| + |x_2 - y_2|$$

for all $x := (x_1, x_2), y := (y_1, y_2) \in \mathbb{R}^2$, the location problem is given by

$$\left[\sum_{i=1}^{m_1} v_i \cdot d_1(x, a^i) \right] + \left[\sum_{j=1}^{m_2} w_j \cdot d_1(x, b^j) \right] \rightarrow \min_{x \in \mathbb{R}^2},$$

where $v_1, \dots, v_{m_1} \in \mathbb{R}$ are positive weights (e.g. demands of the desirable facilities) and $w_1, \dots, w_{m_2} \in \mathbb{R}$ are negative weights (e.g. significance of the repulsion of the undesirable facilities, such as polluting factories or nuclear plants).

Summarizing, in our problem

$$1 \mid P \mid v > 0, w < 0 \mid d_1 \mid \text{median}$$

we search for one new facility (position 1: 1) in the plane (position 2: P), the given attraction facilities have positive weights (position 3: $v > 0$, i.e., $v_i > 0$ for all $i = 1, \dots, m_1$), the given repulsion facilities have negative weights (position 3: $w < 0$, i.e., $w_i < 0$ for all $i = 1, \dots, m_2$) and we consider a median problem (position 5: median), where we measure the distances between points using the Manhattan metric (position 4: d_1).

2. Algorithm information and implementation

The corresponding algorithm included in the current version of the Software FLO generates exact solutions of the above location problem. The program uses an algorithm (Iterative Derivative Algorithm) that is a slight modification of the algorithm proposed by Nickel and Dudenhöffer (1997).

The algorithm was implemented in FLO by Christian Günther. Software FLO has been able to solve the underlying location problem since program version 1.0.0, which was released on 22/04/2015.
